Summary

Past and current governments have supported measures to encourage uptake of Electric Vehicles (EVs, sometimes referred to as Ultra Low Emission Vehicles or ULEVs) as they can contribute to a wide range of transport policy goals. These include improving air quality and reducing noise pollution. They may also have an important role in the 'least cost pathway' to the 2050 net zero greenhouse gas emission target. However, batteries for EVs can require rare elements such as lithium and cobalt, which has raised environmental and ethical issues in countries where these elements are mined. There are also some concerns over 'peak lithium' and future shortages constraining growth in the EV market.

Government policy and grants

The Government's 2018 [Road to Zero Strategy](#) outlines how it will support the transition to zero emission road transport and reduce emissions from conventional vehicles during the transition. It sets out several new measures, including an "ambition" for at least 50% — and as many as 70% — of new car sales to be ultra-low emission by 2030, alongside up to 40% of new vans. There have been widespread calls for the Government to accelerate the uptake of EVs and to phase out conventional petrol and diesel engine vehicles earlier. The Committee on Climate Change (CCC) has recommended that the market for EVs be 100% by 2035 at the latest to meet the new 2050 net zero target.

To meet the aims of the Strategy, Government is (amongst other things) providing grants to make electric vehicle ownership more affordable and to offset the costs of installing chargepoints in the home, workplace and on-street. Eligibility and guidance for these grants is available on for vehicle purchases [here](#) and for chargepoint infrastructure [here](#).

So, how many EVs are on UK roads?

Despite the rise in the number of licensed ULEV cars on UK roads – 200,000 ULEVs were registered in Q4 2018 - ULEVs only represent 0.5% of the total number of cars licensed.

According to the International Energy Agency's 2017 EV outlook, these figures place the UK fourth worldwide by market share, and seventh by volume. Going forward, projections by National Grid suggest that the UK stock of EVs could reach between 2.7 and 10.6 million by 2030 and could rise as high as 36 million by 2040.

Where are the EV chargepoints?

Data available from the [European Alternative Fuels Observatory](#) shows that the number of EV charge points per 100km of road in the United Kingdom has increased from 42 in 2011 to 570 in 2019. The Committee on Climate Change (CCC) says this figure will need to increase further to match the rising number of EVs on the road. The Government however envisages most charging to take place at home describing it as a "key attraction" of EV ownership. Through the Road to Zero Strategy, the Government has committed £400m to the public-private Charging Infrastructure Investment Fund and says it plans to consult on proposals that would require chargepoint infrastructure for new dwellings in England.

How will increasing numbers of EVs impact the electric grid?

Concerns have been raised that increasing the number of electric vehicles will add to electricity demand and place pressure on the UK's grid network, operated by National Grid. While National Grid do expect electricity demand to increase, they have said that policies and incentives should be able to address the increase in demand to reduce the impact on the UK's electricity system.

1. Introduction

1.1 What are Electric Vehicles?

Electric vehicles (EVs, sometimes referred to as Ultra Low Emission Vehicles or ULEVs) run on electricity some or all the time. There are several different types, as described by the Parliamentary Office of Science and Technology (POST) in its POSTnote on Electric Vehicles (see box 1).¹

Box 1: What is an Electric Vehicle?

Electric vehicles use electric motors to drive their wheels. They derive some or all of their power from large, rechargeable batteries. The distance an EV can drive between recharges is known as its range.

Different categories of EV include:

- **All-electric EVs**, where the battery is the only power source. Most current (non-luxury) models have a quoted range of 80-120 miles (130-190 km). In practice, range varies according to driving style, terrain and the use of auxiliary equipment such as heating/air conditioning.
- **Plug-in Hybrids (PHEVs)** can switch between running on electricity or fossil fuels. They typically have a smaller battery, and therefore a lower battery powered range of between 10-40 miles (15-60 km). However their maximum range is equivalent to a petrol car. Both plug-in hybrid and all-electric EVs are recharged by plugging them in to the electricity grid (see image).
- **Hybrids (HEVs)** which do not plug in, such as the Toyota Prius, have a much smaller battery which is recharged while driving. HEVs can drive in electric mode for a few miles.
- **Fuel Cell Vehicles** generate their own electricity on-board from a fuel such as hydrogen, and do not need to plug in to the electricity grid to recharge. Re-fuelling is similar to a petrol car.

1.2 Why do we need Electric Vehicles?

Past and current governments have supported measures to encourage uptake of EVs as they can contribute to a wide range of transport policy goals.² EVs can help to improve air quality, reduce noise pollution and support efforts to reduce carbon emissions.

For instance, a 2018 report of the European Environment Agency found that electric vehicles offer “clear benefits” for local air quality largely due to zero exhaust emissions at street level. However, the report noted that even electric vehicles emit particulate matter from road, tyre and break wear.

Moreover, [updated advice on meeting the net zero 2050 target](#) was published in May 2019 by the Committee on Climate Change (CCC) – the statutory advisors on emissions reductions for Government. This said that the market for electric cars and vans should scale up to 100% of

¹ POST, [Electric vehicles](#) (POSTnote 365), 1 October 2010, p1

² IEA, *Global EV Outlook 2018*,

5 Electric vehicles and infrastructure

new sales by 2035 at the latest (and ideally by 2030).³ Under the older 80% reduction target by 2050, the CCC advised a 'least cost' pathway would need 60% of all new cars and vans sold should be electric by 2030 (see box 2 for further information on transport emissions).⁴

Box 2: Transport emissions

As of 2017, transport was the largest-emitting sector of the UK economy at 126 MtCO₂e, accounting for 28% of UK greenhouse gas (GHG) emissions. The CCC has recommended that if the UK is to meet the 2050 net zero target the market for electric cars and vans should scale up to 100% of new sales by 2035 at the latest (and ideally by 2030).⁵

Progress in reducing emissions in the transport sector have been slow. Average vehicle emissions from the UK fleet have fallen.⁶ In 2018 the average CO₂ emissions of newly registered vehicles was 124.9 grams per kilometre (g/km). This is down from 178.8 g/km in 2001 and represents a decrease of around 30%. Between 2001 and 2018 the average CO₂ emissions of newly registered vehicles were falling year on year although began to rise from mid-2016. According to the DFT this increase was: "*broadly due to a shift towards registering larger cars (which have higher emissions) and increases in emissions for popular petrol car models. The introduction of WLTP in September 2018 caused a marked increase in average CO₂ emissions. However, changes from September 2018 are not directly comparable with previous periods.*"⁷

The [CCC says](#) that most action to reduce emissions from the transport sector had been driven by EU regulations, rather than domestic policy.⁸ Since 2015, the EU has set mandatory emission reduction targets for new cars.⁹ Further, the CCC says renewed efforts are needed to encourage consumers to buy more efficient vehicles.¹⁰

EU vehicle emission targets

Since 2009, EU legislation has set mandatory emission reduction targets for new cars.

- Since 2015, a target of 130 g CO₂/km applies for the EU fleet-wide average emission of new passenger cars.
- From 2021, phased in from 2020, the EU fleet-wide average emission target for new cars will be 95 g CO₂/km.

There are penalties for manufacturer's if the average CO₂ emissions of a manufacturer's fleet exceed its target in a given year. This **excess emissions premium** for each car registered is set by the Commission as follows:

- €5 for the first g/km of exceedance
- €15 for the second g/km
- €25 for the third g/km
- €95 for each subsequent g/km.

From 2019 on the penalty will be €95 for each g/km of target exceedance.¹¹

1.3 How many Electric Vehicles are on UK roads?

ULEVs represent a tiny percentage of the overall vehicle fleet. The Government is keen to highlight the growth rate, rather than the absolute numbers on the roads.

Data on the number of licensed ultra-low emission vehicles (ULEVs)¹² is available from the Department for Transport's [Vehicle licensing statistics dataset](#). Data on the number of licensed vehicles is available by quarter since 2010. The chart below shows how the number of ULEV vehicles in the United Kingdom has increased from around 9,500 at the end of Q1 2010 to 200,000 at the end of Q4 2018. This is an increase of 1,732%. At the end of Q1 2014 the number of licensed ULEV cars overtook the number of vehicles of other types. Currently cars account for around 93% of all licensed ULEV vehicles. Other ULEVs include vans, scooters, HGVs etc.

Licensed ultra low emission vehicles

The number of licensed ultra low emission vehicles (ULEVs) at the end of quarter, United Kingdom

Source: Department for Transport, Vehicle licensing statistics: table VEH0130

Despite the rise in the number of licensed ULEV cars on UK roads, as a proportion of the total number of cars licensed ULEVs represent a tiny share. In 2018 around 59% of licensed cars were petrol, 39% diesel and 0.5% were either a plug-in-hybrid, battery electric, range-extended electric, or fuel cell electric car.

¹² Ultra low emission vehicles (ULEVs) are vehicles that emit less than 75g of carbon dioxide (CO₂) from the tailpipe for every kilometre travelled. In practice, the term typically refers to battery electric, plug-in hybrid electric and fuel cell electric vehicles.

2. Government measures to encourage uptake of EVs

Past and current governments have supported measures to encourage uptake of EVs through a mixture of different policies, targets and grants and incentives to individuals buying new vehicles (see box 3 for historical overview of pre-2015 policies and select committee reports).

Box 3: Past Government policies and select committee reports

Labour Government:

The [Labour Government published its ULEV strategy](#) in April 2009.¹³ It said it would provide £20 million “seed money” to support the development of lead cities and regions in building the necessary charging infrastructure to help increase consumer confidence that would make ultra-low carbon vehicles viable. The Strategy also expected the private sector ultimately to take the lead in infrastructure provision.

The Labour manifesto for the 2010 General Election promised to “ensure there are 100,000 electric vehicle charging points by the end of the next Parliament”.¹⁴

Coalition Government:

The 2010 [Coalition Agreement](#) contained a commitment to “mandate a national recharging network for electric and plug-in hybrid vehicles”.¹⁵ In delivering on this mandate, the Government’s June 2011 [EV infrastructure strategy](#) said that its approach was “not to mandate ‘a chargepoint on every corner’ – this is not necessary to help the market grow and would be uneconomic”.¹⁶ Rather, it said the majority of recharging is likely to take place at home and at work, so an extensive public recharging infrastructure would be underutilised and uneconomic. Labour said at the time that this represented a renege on the Coalition’s commitment to a ‘national charging network’.¹⁷ However, others, including manufacturers of electric vehicles, supported the Government’s claim that most charging would be done at home or in the workplace and that the need for public recharging points was therefore limited.¹⁸

The Government’s April [2014 strategy paper on ULEVs](#) pledged that by the end of 2014 there would be a rapid chargepoint at every motorway service station and that there would be a network of over 500 rapid chargers across the country by March 2015. It also pledged £32m for charging infrastructure in 2015-20.¹⁹

the Environmental Audit Select Committee assessed policies for ULEVs in its September 2016 report: [Sustainability at the DfT](#).²² The [Government response](#) was published on 11 November 2016.²³

2.1 Road to Zero strategy

The Government published its [Road to Zero Strategy](#) in 2018. This strategy outlines how it will support the transition to zero emission road transport and reduce emissions from conventional vehicles during the transition. The strategy is “long term in scope and ambition, considering the drivers of change, opportunities and risks out to 2050 and beyond”.²⁴ It sets out several new measures, including:

- an “ambition” for at least 50% — and as many as 70% — of new car sales to be ultra-low emission by 2030, alongside up to 40% of new vans.
- a push for chargepoints to be installed in new build homes, where appropriate, and new lampposts to include charging points
- the launch of a £400 million charging infrastructure investment fund to help accelerate the roll-out of charging infrastructure by providing funding to new and existing companies that produce and install charge points.
- providing up to £500 for electric vehicle owners to put in a charge point in their home through the electric vehicle homecharge scheme.
- the extension of the plug-in car and van grants to at least October 2018 at current rates, and in some form until at least 2020
- the launch of an electric vehicle energy taskforce to bring together the energy and automotive industries to plan for the increase in demand on energy infrastructure that will result from a rise in the use of electric vehicles.²⁵

To achieve the ambitions set out in the Road to Zero strategy, “the Government is investing nearly £1.5 billion between April 2015 and March 2021, with grants available for plug-in vehicles and schemes to support chargepoint infrastructure.” Parliamentary Under-Secretary for Business, Energy and Industrial Strategy, Andrew Stephenson described these measures as “one of the most comprehensive support packages in

²⁵ DfT, [Reducing emissions from road transport: Road to Zero Strategy](#), July 2018

the world for zero emission vehicles.”²⁶ Further, Chris Grayling, Secretary of State for Transport, said:

The coming decades are going to be transformative for our motor industry, our national infrastructure and the way we travel. We expect to see more change in the transport sector over the next 10 years than we have in the previous century.

We are expecting our economy and society to experience profound change, which is why we have marked the Future of mobility as one of the 4 grand challenges as part of our modern Industrial Strategy.

The Road to Zero Strategy sets out a clear path for Britain to be a world leader in the zero emission revolution - ensuring that the UK has cleaner air, a better environment and a stronger economy.²⁷

2.2 EV targets

In the [Road to Zero strategy](#), the Government set an “ambition” for at least 50% — and as many as 70% — of new car sales to be ultra-low emission by 2030, alongside up to 40% of new vans.²⁸ This target followed up on a number of other announcements of targets:

- In 2015, the Government set a target to “ensure almost every car and van is a zero emission vehicle by 2050”.²⁹
- In July 2017, the Government announced that “it will end the sale of all new conventional petrol and diesel cars and vans by 2040”³⁰
- In May 2018, the Prime Minister announced a further target for 2040, that all new cars and vans should be “effectively zero emission.”³¹

...the Government set an “ambition” for at least 50% — and as many as 70% — of new car sales to be ultra low emission by 2030, alongside up to 40% of new vans.

Alongside the sales targets, the Government has set a goal for the UK to be “a world leader in the development, manufacture and use of zero emission vehicles... [and] in the design, development and manufacture of batteries” in the Automotive Sector Deal.³²

Critics, however, have suggested the targets in the Strategy were not clear and not ambitious enough. Responding to the publication, the [CCC said the targets lacked clarity](#) leaving open the possibility of sales of conventional hybrids and very short range plug-in hybrids in 2040 and following years, which is inconsistent with the UK’s climate change commitments.³³

³² HM Government, [Industrial Strategy Automotive Sector Deal](#), 2018

³³ CCC, [Government’s Road to Zero Strategy falls short, CCC says](#), 10 July 2018

[Dustin Benton, policy director of Green Alliance, told *Business Green*](#)

there was widespread agreement across “the oil industry, mayors and environmentalists” that the 2040 target to end the sale of all new conventional petrol and diesel cars and vans was too late. He said that:

“Moving it to 2030 and setting a zero emissions vehicles mandate, as both China and California have done, would encourage car companies to build electric cars in the UK, and give the country a head start on its competitors across Europe.”³⁴

Later in the year, Lord Deben, CCC Chairman, wrote to the Secretaries of State for Transport and Business, Energy and Industrial Strategy (BEIS), to share the CCC’s full assessment of the Strategy. In this letter, Lord Deben said “the commitment to end sales of conventional petrol and diesel vehicles should be brought forward to 2035 to ensure road transport emissions are near-zero by 2050.”³⁵ The Government has stated that its ambitions “strike the right balance between conflicting environmental, industrial and consumer priorities.”³⁶

Since the Road to Zero strategy was published, the Government has legislated for a [net zero by 2050 target](#). Under this target, the CCC has said the EV market should scale up to 100% of new sales by 2035 at the latest (and ideally by 2030).³⁷ The older 80% reduction target would have only necessitated for 60% of all new cars and vans sold should be electric by 2030, according to CCC analysis.³⁸

There is some evidence that sales of diesel vehicles are already on the wane. A study by UBS in 2016 predicted that diesel would “almost disappear” from the global car market within 10 years if competition from cheaper electric cars and tougher stances by regulators come to pass.³⁹

In February 2019, Transport Minister, Jesse Norman, stated that “the Government is actively tracking market developments and will review progress towards our ambitions by 2025.”⁴⁰

EV market forecasts

The number of EVs on UK roads has been increasing year-on-year. In addition, more models of EVs are becoming available. As charging infrastructure improves and the costs of EVs decreases, market analysts are forecasting that more people will purchase EVs over petrol and diesel vehicles.

- [Research published by Accenture Strategy](#) in April 2019 forecast EV sales to grow exponentially, and for over half of all UK vehicles sales to be EVs by 2040.⁴¹

the 2040 target to end the sale of all new conventional petrol and diesel cars and vans [is] too late.

- Bloomberg's New Energy Finance [Electric Vehicle Outlook 2019](#) has forecasts for global EV markets. This report forecasts global EV sales to rise to 10million in 2025, 28 million in 2030 and 56million in 2040.⁴³

2.3 Charging Infrastructure

Without enough chargepoints EV ownership is not practical. There is currently some uncertainty as to how many EV chargepoints are needed, and where they should be located – at home, on the road network, in streetlamps etc. Government-commissioned research, published in August 2015, commented that public charging was seen to have two overlapping but different roles:

... meeting the needs of existing owners and addressing the concerns of potential future EV owners about buying an EV. Existing EV owners rely mostly on home and workplace charging but consistently report a desire for more extensive – and fast – public charging to enable them to undertake longer journeys. The evidence also suggests that additional public charging infrastructure can help to address the range concerns of potential future EV owners and increase EV uptake. Current public charging provision in the UK is comparable, even favourable in certain respects, to provision in countries with more developed EV markets.⁴⁴

The Government has taken several measures to ensure there will be enough chargepoints installed in the coming years (detailed below). Transport Minister, Michael Ellis, sets out the Government's vision for a vehicle charging network as follows:

Our vision is to have one of the best electric vehicle infrastructure networks in the world. This means current and prospective electric vehicle drivers are able to easily locate and access charging infrastructure that is affordable, reliable and secure.⁴⁵

Availability of charging points: "Range anxiety"

Developments in EVs and battery technology mean some vehicles already have the range necessary to meet the needs for most journeys without having to charge.⁴⁶ However, range anxiety – fears over the distance EVs can travel between charges – is often cited as one of the key barriers to people opting to buy EVs.

Linked to this is the availability of charging points. In a survey conducted for OVO energy – a small energy supplier – fears over a lack of charging points was cited as the number one reason for not buying an EV.⁴⁷

⁴² Emu Analytics, [A Sustainable Future Preparing for Electric Vehicles](#), May 2018

⁴⁵ [PQ265457](#) [Electric Vehicles: Charging Points] 20 June 2019

⁴⁶ ["Plugging the gap: What next for Britain's EV public charging network?"](#), CCC blog, 19 Jan 2018

⁴⁷ OVO Energy, [What's stopping the 'electric vehicle revolution'?](#), Sept 2017

Indeed, public chargepoints are still unevenly distributed across Great Britain meaning access to chargepoints is still something of a “postcode lottery”, according to analysis by HSBC in 2016.⁴⁸

Highways England has a commitment of £15m to ensure there are chargepoints (rapid where possible) every 20 miles on 95% of the Strategic Road Network by 2020.⁴⁹ Moreover, the number of public chargepoint connectors and locations in the UK is increasing. Data available from the [European Alternative Fuels Observatory](#) shows that the number of EV charge points per 100km of road in the United Kingdom has increased from 42 in 2011 to 570 in 2019. Most charge points remain to be those with a charge rate of less than or equal to 22kW. As of June 2019, ZapMap reported⁵⁰ in Great Britain there were:

- 8,639 public charging points (of which 1,507 were rapid);
- 13,817 devices (of which 2,195 were rapid); and
- 23,478 connections (of which 5,062 were rapid)⁵¹.

Even so, the number of chargepoints will need to increase further to match the rising number of EVs on the road. The [CCC commissioned research](#), published in January 2018, to assess future demand for Britain’s electric vehicle public charging network.⁵² This analysis was based on the CCC’s ‘central scenario’ which envisages EVs accounting for 60% of new car and van sales (approximately 30% of the total fleet) by 2030. The report’s key findings were:

the number of chargepoints will need to increase further to match the rising number of EVs on the road

- The number of rapid chargers located near the major roads network needs to expand from 460 in 2016 to 1,170 by 2030.
- The number of public chargers needed for ‘top-up charging’ needs to rise from 2,700 in 2016 to over 27,000 by 2030.
- Overall nearly 29,000 charging points are needed across Great Britain by 2030, of which around 85% of these are fast (22kW) or rapid (43+kW) chargers.⁵³

This analysis does not include the number of private chargepoints on EV owners’ homes. The Government envisages the majority of charging to take place at home.⁵⁴ Indeed, the Government identifies homecharging as a “key attraction” of owning an EV.⁵⁵

⁴⁸ [“Owners of electric cars are struggling to get plugged in”](#), *The Times*, 24 September 2016

⁴⁹ [PQ 267734](#) [Electric Vehicles: Charging Points] 27 Jun 2019

⁵⁰ ZapMap.com [accessed: 10 June 2019]

⁵¹ EV chargepoint sites can have multiple charging devices. Additionally, EV charging devices can have multiple connectors. This means one chargepoint can have multiple available charging connections allowing more than one EV to charge at any one time.

⁵⁵ DfT, [Reducing emissions from road transport: Road to Zero Strategy](#), July 2018, p. 83

There is no duty on local authorities to provide electric charging points, it is up to them to decide, based on local priorities, whether to do so. In November 2017 the Mayor of London, Sadiq Khan, said that there had been opposition to the installation of EV charge points in some areas after complaints by residents.⁵⁶ In January 2018, Government ministers announced that they had written to local councils calling on them to “do more to help reduce carbon emissions and tackle air quality after it emerged just 5 councils in the whole of the UK” had have taken advantage of the On-Street Residential Chargepoint Scheme (see below).⁵⁷

Government policy and grants

The Government’s current approach to delivering chargepoint infrastructure was set out by Baroness Vere of Norbiton, Parliamentary Under Secretary of State for Transport, in response to a PQ as follows:

The Government’s vision is to have one of the best electric vehicle infrastructure networks in the world but has not set targets for the number of chargepoints. We want to encourage and leverage private sector investment to build and operate a self-sustaining public network supported by the right policy framework. In many cases, the market is better-placed than the Government to identify the right locations for chargepoints and it is essential that viable commercial models are in place to ensure continued maintenance and improvements to the network.⁵⁸

To ensure EV owners can enjoy one of the “key attractions” of owning an EV⁵⁹ – home charging – the Government has created a grant scheme to help support the installation of chargepoints at home, as well as in the workplace and on local streets.⁶⁰

- The [Electric Vehicle Homecharge Scheme \(EVHS\)](#) provides grant funding of up to 75% towards the cost of installing electric vehicle chargepoints at domestic properties across the UK.
- EV chargepoints cannot be installed in all properties. For instance, terraced or apartments properties may not have allocated off-street parking. The [On-street Residential Chargepoint Scheme \(ORCS\)](#) provides grant funding for local authorities towards the cost of installing on-street residential chargepoints for plug-in electric vehicles.
- The [Workplace Charging Scheme \(WCS\)](#) is a voucher-based scheme that provides support towards the up-front costs of the purchase and installation of electric vehicle charge-points, for eligible businesses, charities and public sector organisations.

Furthermore, the Government’s Road to Zero Strategy outlines its intention to for all new homes to have a chargepoint available. The

⁵⁶ “Electric cars hampered by fear of charge-point clutter”, *The Times*, 27 November 2017

⁶⁰ For more information on eligibility and guidance on how to apply for these grants, please see [the Office for Low Emission Vehicles \(OLEV\) website](#).

Government says it plans to consult on proposals that would require chargepoint infrastructure for new dwellings in England, where appropriate in the most cost effective way, and mindful of the Government's Housing supply objectives.⁶¹ No timetable for this consultation has been published.

Improving consumer experiences: Automated and Electric Vehicles Act 2018

In 2018, the Government legislated to help deliver the aim in the Conservative Manifesto for almost every car and van to be a zero emission vehicle by 2050.⁶² Taken together, the powers in the [Automated and Electric Vehicles Act 2018](#) allow Government to regulate, if necessary, in the coming years to:

- improve the consumer experience of electric vehicle charging infrastructure;
- ensure provision at key strategic locations like Motorway Service Areas; and
- require that charge points have 'smart' capability.

The measures were broadly welcomed. However, some groups noted that this was all contingent on the details to be included in the Secondary Legislation. Until then, they argued, the Act resembles no more than a wish list.⁶³

One of the main groups affected by the measures in the Act will be petrol retailers. Responding to the main provisions, the [Petrol Retailers Association \(PRA\)](#) said they considered the powers granted to be unnecessary. The PRA felt the best course of action would be to allow the market to dictate the uptake of EV charging infrastructure. Brian Madderson, Chairman of the PRA commented:

"The best course of action the government can take to ensure the UK has a well- developed EV charge point infrastructure, especially away from urban centres and major roads, would be to create a grant scheme for forecourt retailers - similar to the Homecharge and Workplace schemes which are already in place."⁶⁴

In 2018, the Government legislated to help deliver the aim in the Conservative Manifesto for almost every car and van to be a zero emission vehicle by 2050.

2.4 Vehicle grants

EVs are currently more expensive than equivalent internal combustion engine vehicles and are not projected to reach price parity until the mid-2020s.⁶⁵ The CCC assessment of the Road to Zero Strategy said that "Financial support for the higher upfront costs of electric vehicles (EVs) will be required beyond 2020." The CCC suggest "minor amendments to vehicle excise duty (VED) and company car tax (CCT) can support

⁶¹ DfT, [Reducing emissions from road transport: Road to Zero Strategy](#), July 2018, p. 83

⁶⁴ ["PRA continues to lobby for investment into charging infrastructure"](#), 1 Feb 2018

⁶⁵ Bloomberg New Energy Finance, [Electric Vehicle Outlook: 2018](#), May 2018

continued improvement in fleet efficiency.”⁶⁶ (see box 4 for more on VED).

To make electric vehicle ownership more affordable, the Government offers plug-in grants (launched in 2011). The amount of grant depends on which category the vehicle is in. The five categories and their eligible grants are detailed in the table below. Prior to October 2018, there were three categories of car eligible for a grant when the DfT announced changes to grant levels. The updated grant levels are reflected in the table below.

Category	CO2 emissions	Zero emission range	Grant	Maximum amount
Car	Less than 50g/km	112km (70 miles)	35%	Up to £3,500
Motorcycles	No CO2	50km (31 miles)	20%	Up to £1,500
Mopeds	No CO2	30km (19 miles)	20%	Up to £1,500
Vans	Less than 75g/km	16km (10 miles)	20%	Up to £8,000
Taxis	Less than 50g/km	112km (70 miles)	20%	Up to £7,500

Low-emission vehicles eligible for a plug-in grant

The Road to Zero Strategy says the Government would continue the plug-in car grant until at least 2020, but that by 2020, with rising sales, “long-term continuation of the plug-in car grant will become unviable in terms of cost to the taxpayer”. Therefore, the Government expects to deliver “a managed exit from the grant in due course” and to provide support through other measures.⁶⁷

Eligibility and guidance for these grants is available on [Gov.uk](https://www.gov.uk).

As of May 2019, the plug-in car grant had contributed to the purchase of around 100,000 plug-in hybrid cars, at a cost of over £360 million.⁶⁸

Changes to plug-in grants scheme, 2018

Previously, there were three categories of car eligible for a grant. In October 2018, the DfT announced changes to grant levels, removing the grants for hybrid EVs (formerly category 2 and 3 EVs).⁶⁹ At the same time, the maximum grant available for EV cars (formerly a category 1

the Government expects to deliver “a managed exit from the grant in due course” and to provide support through other measures.

⁶⁶ [Letter to Chris Grayling and Greg Clark – assessment of the Road to Zero Strategy](#), 11 October 2018

⁶⁸ [PO 252016](#) [Electric Vehicles: Grants] 17 May 2019

⁶⁹ OLEV, [Changes to the Plug-in Car Grant](#), 2 Nov 2018

EV) was lowered from £4,500 to its current level of £3,500. Transport Minister, Jesse Norman, explained that these changes reflected a shift “to focus on zero tail pipe emission vehicles.”⁷⁰

The automotive industry called for the Government to rethink these changes. Reacting to the announcement, Mike Hawes, Chief Executive of the Society of Motor Manufacturers and Traders (SMMT), said:

We understand the pressure on the public purse but, given the importance of environmental goals, it’s astounding that just three months after publishing its ambitious vision for a zero emissions future, government has slashed the very incentive that offers our best chance of getting there.

Industry is working hard to address the challenges of CO2 and air quality but, while it can produce the technology, it cannot determine the pace of uptake.

We have consistently said that if the UK is to be fit for an electrified future, we need a world-class package of incentives and infrastructure. Government needs to rethink its policy, else its ambitions will never be realised.⁷¹

Further, the Commons Business, Energy and industrial Strategy (BEIS) Committee criticised the Government’s decision in its inquiry into EVs. The Committee felt that the decision had been “made too soon and too suddenly” and “risked undermining the UK’s burgeoning EV market.”⁷² Instead, the Committee called for the grants to be maintained until the cost of EVs nears price parity with conventional Internal Combustion engine vehicles.

The Government is confident that the changes to the grants available are working. In response to a PQ, Transport Minister, Jesse Norman, said that since the 2018 changes were introduced

...overall sales of alternatively fueled vehicles have increased compared to the same period last year. While the sales of zero emission capable plug-in hybrids have decreased since the grant was reviewed, the sales of the cleanest zero emission vehicles have increased by over 50 per cent over the same period.⁷³

The Government is confident that the changes to the grants available are working.

Box 4: Fiscal incentives and Vehicle Excise Duty

Fiscal incentives have been shown to drive behaviour changes. Car registration taxes in the UK since 2001 increased the number of diesel vehicles on the road. In 2001, just 13.8 per cent of new car registrations were diesel but this had risen to 39.3 per cent by 2018.

Vehicle Excise Duty (VED) is an annual tax levied for most types of vehicles to be used (or parked) on public roads. Certain vehicles are exempt from paying VED.

Since 2003, VED rates have been linked to emissions, meaning lower emission cars pay lower rates. From 2003 to 2017 cars that emitted less

⁷⁰ [PQ 252016](#) [Electric Vehicles: Grants] 17 May 2019

⁷¹ SMMT, [Automotive industry calls for plug-in grant rethink as cuts put Government ambition at risk](#), 12 Oct 2018

⁷² Business, Energy and Industrial Strategy Committee, [Electric vehicles: driving the transition](#), Fourteenth Report of Session 2017–19, **HC 383**, para 33-36

⁷³ [PQ 252016](#) [Electric Vehicles: Grants] 17 May 2019

than 100g/km of carbon dioxide were exempt from VED. Rates for other vehicles were on a sliding scale, with the most polluting paying the highest levels of tax.

Major reforms to VED were introduced in the 2015 budget (taking effect from 1 April 2017). Cars that emit less than 50g/km of carbon dioxide continue to be exempt, but all other vehicles now pay the same standard rate (the rate after the first year of registration). Cars with a list price greater than £40,000 also pay a supplement of £310 for the first five years in which a standard rate is paid.

In practice the strict 50g/km limit means that only fully-electric vehicles qualify for the exemption, and the flat rate for other vehicles has removed the incentive to purchase alternative ultra-low emissions vehicles, such as plug-in hybrid EVs or hydrogen fuel cell cars. Further, as electric vehicles are more expensive than equivalent conventional models, they are disproportionately affected by the VED supplement.

The Library brief, [Vehicle Excise Duty \(VED\)](#) provides an extensive background and overview of the evolution of VED.

Who benefits from vehicle grants and how accessible is EV ownership?

There are questions over who benefits from plug-in grants. Research commissioned by the Government and published in August 2015 found that the sorts of people who tend to buy ULEVs are “middle-aged, male, well-educated, affluent, and live in urban areas with households containing two or more cars and with the ability to charge at home” and that this socio-demographic profile of ULEV owners in the UK was “not likely to change significantly”.⁷⁴

The BEIS Committee concluded that “EVs should not be the sole preserve of the relatively affluent.” The Committee recommend that the Government introduce more creative support mechanisms to ensure that all motorists are able to benefit from EVs.⁷⁵

Developing the second-hand market for EVs will be important to increase accessibility. This would make EVs more affordable to consumers who typically do not purchase new vehicles. Additionally, a buoyant second-hand market for EVs could support the growth of the wider national EV fleet by bolstering the economic case for new EVs.⁷⁶ ENGIE – an energy company – told the BEIS Committee the Government should

...review the secondary market for electric vehicles and puts pressure on manufacturers and retailers to rethink how this market might be stimulated. Government should also consider how this market could be stimulated from the consumer (buyer and seller) viewpoint, highlighting the value for money used electric vehicles represent against alternatives in the market.

3. International comparisons

For some years sales of ULEVs were lower than expected in other parts of the world, with the falling price of gas cited as the main disincentive for switching from petrol and diesel vehicles to electric.

For example, in the US only about 400,000 electric cars were sold by the final year of President Obama's term: less than half of his goal of getting one million plug-in electric vehicles on the roads by 2015.⁷⁸

In October 2017 the International Energy Agency (IEA) reported that the number of electric vehicles on the road increased to 2 million in 2016. China was by far the largest electric car market, accounting for more than 40% of the electric cars sold in the world and more than double the amount sold in the US. Norway achieved the most successful deployment of EVs in terms of market share, followed by the Netherlands and Sweden.⁷⁹

3.1 Targets and bans around the world

The BEIS Committee has described the UK's targets to: (i) phase out diesel and petrol vehicles and (ii) increase EV ownership as unambitious.⁸⁰ The Committee compared these targets to those in other countries around the world and found the UK risked falling behind which may result in the UK having "to accept vehicle emission standards set by more ambitious international regulations."⁸¹

The Committee referred to the CCC's analysis of bans on petrol and diesel vehicles in other countries that shows the even within the UK separate countries had more ambitious targets:

Table 1: Government commitments to the end of sales of conventional vehicles

Country	Timing
Norway	2025
India, China, Slovenia, Austria, Israel, the Netherlands, Ireland	2030
Scotland	2032
UK, France, Sri Lanka, Taiwan	2040

⁸¹ Business, Energy and Industrial Strategy Committee, [Electric vehicles: driving the transition](#), Fourteenth Report of Session 2017–19, **HC 383**, para 24

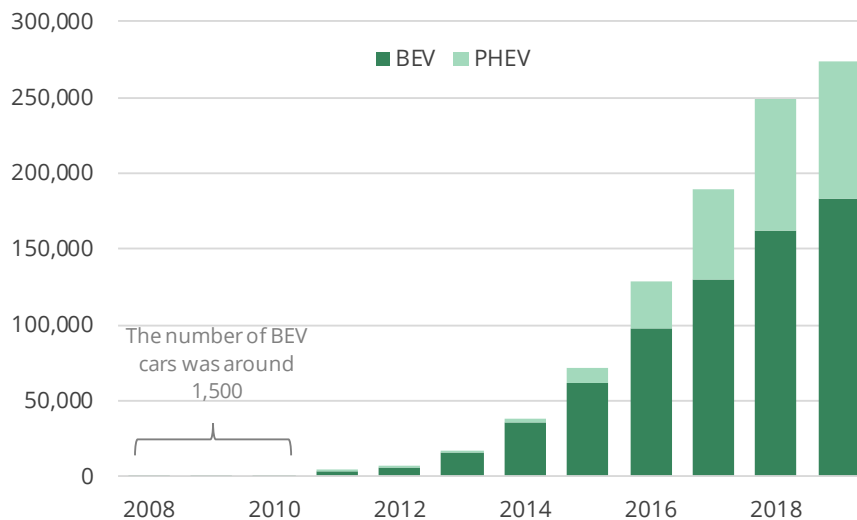

3.2 Norway

Norway has been by far the most successful country in achieving EV market penetration. The IEAs 2017 EV outlook highlighted that Norway had the fourth largest volume of sales of EVs in the world in 2017 (behind only much larger countries: the US, China and France) and the largest market share.⁸² The UK by comparison is ranked fourth worldwide by market share, and seventh by volume. Projections by National Grid suggest that the UK stock of EVs could reach between 2.7 and 10.6 million by 2030, and could rise as high as 36 million by 2040.⁸³

In Norway, the [number of electric passenger](#) cars has increased substantially over the last decade: in 2008 the number of cars which were Battery Electric Vehicles (BEV) was around 1,500. In 2019 there were just under 183,000. This is around a 14,600% increase. If we include Plug-in Hybrid Vehicles (PHEV) the number of cars which were powered (at least in part) by electricity numbered 274,000 in 2019. In 2018 around 50% of all new car registrations were either BEV or PHEV. According to the [Norwegian equivalent of the ONS](#), there were 2.7 million registered cars in 2018, this means that BEV and PHEV cars accounted for around 10% of the total car stock.

Electric cars in Norway

The number of electrically powered passenger cars by 'Battery Electric Vehicles' and 'Plug-in Hybrid Electric Vehicles'

Source: European Alternative Fuels Observatory

The most important incentives driving Norway's success have been long-term and financial. In addition, the Norway Government has committed to the end of sales of conventional vehicles in 2025.

⁸² As quoted in Business, Energy and Industrial Strategy Committee, [Electric vehicles: driving the transition](#), *Fourteenth Report of Session 2017–19*, HC 383, p.7

⁸³ National Grid, [Future Energy Scenarios](#), Jul 2018

Incentives for EV car ownership in Norway have been in place for many years. They have been designed to make EV ownership less expensive than conventional petrol or diesel vehicles. The support Norway provides includes:

- **Exemptions from the vehicle registration tax for Battery EVs** (1990-). Norway levies a registration or import tax on cars, which can reach EUR 10,000 or more depending on the car model's CO2 emissions. BEVs are exempted from the tax. Plug-in hybrid electric cars also pay a lower tax. The exemption is expected to run out at the end of 2020, but due to the low-emissions, BEVs will still pay a lower amount.
- **Low annual road tax** (1996-). Battery EVs pay a lower annual road tax. Instead of NOK 3,060 or (~EUR 367), owners of BEVs pay NOK 435 (~ EUR 52). The annual tax increased to half the rate of fossil fuelled cars in 2018 and will increase to the full rate in 2020.
- **Free municipal parking** (1999-). Local governments can decide on incentives such as access to bus lanes and free municipal parking.
- **Reduced company car tax** (2000-). Norway provides a 40% reduction on the company car tax.
- **Exemption from 25% VAT on purchase** (2001-). Battery EVs are exempted from paying the value added tax of 25% on the purchase or leasing rate. The VAT exemption for electric cars is prolonged until 2020
- **No charges on ferries or toll roads** (2009-). Battery EVs enjoy exemptions from road tolls and ferries. This can be a substantial saving amounting to several thousand Euros a year on certain roads. Complete exemption for toll roads will likely be phased out over the coming years.⁸⁴

Altogether, this approach makes the total cost of ownership less expensive for Plug-In Electric Vehicles than for a comparative internal combustion engine vehicle.⁸⁵

⁸⁴ Dr. Karoline Steinbacher, Minke Goes, Korinna Jörling, [Incentives for Electric Vehicles in Norway: Fact Sheet](#), September 2018

⁸⁵ Dr. Karoline Steinbacher, Minke Goes, Korinna Jörling, [Incentives for Electric Vehicles in Norway: Fact Sheet](#), September 2018

4. Additional Electricity Demand

Increasing the number of electric vehicles will add to electricity demand and place pressure on the UK's grid network, operated by National Grid (see concerns raised in Box 4).

National Grid (NG) publish an annual [Future Energy Scenarios](#) (FES) report. These reports provide what NG describe as "a range of credible futures" in the energy sector but are not intended to be a forecast of future electricity demand. The reports cover demand from different sectors, such as electric vehicles (as part of transport) but also industrial, commercial, and residential demand for both electricity and gas.

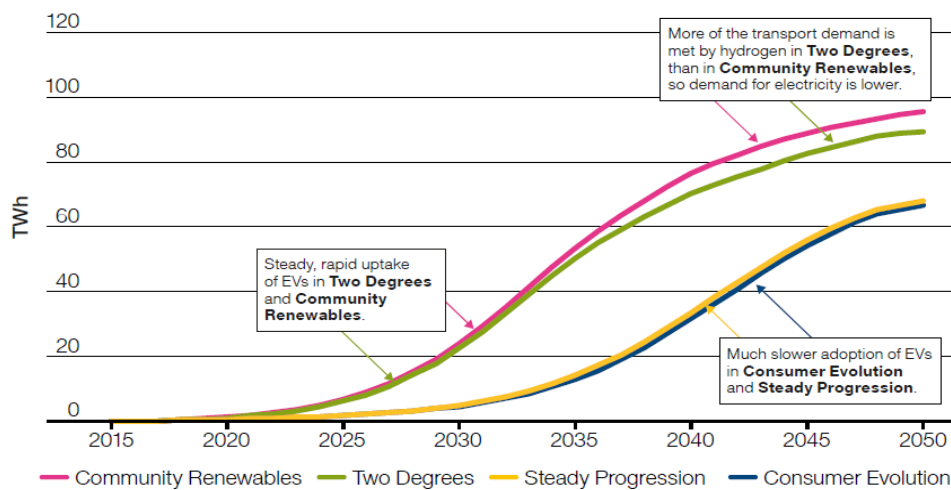

The [2019 FES](#) had four scenarios; Community Renewables and Two Degrees (which both meet the Government's 2050 net zero decarbonisation target⁸⁶) and Steady Progression and Consumer Evolution (which do not meet the 2050 target).⁸⁷ The scenarios differ in the speed of decarbonisation and level of decentralisation.

On electric vehicles adding to electricity demand, the 2019 FES found that total energy demand for road transport fell across all scenarios:

Total energy demand is similar across scenarios, but the speed at which vehicles shift from petrol and diesel to electricity, natural gas or hydrogen varies across scenarios. Total annual energy demand for road transport is currently around 500 TWh. By 2050 it has reduced, in all scenarios, to below 200 TWh. This is due to the shift from petrol/diesel vehicles to electric vehicles, which use less energy per mile; causing a significant drop in total energy used for transport.⁸⁸

Despite a fall in overall energy demand, the shift to electric vehicles clearly results in increases in electricity demand in all scenarios. This is shown in the figure below from the 2019 FES:

Annual road transport electricity demand – TWh/year

National Grid: System operator

National Grid owns the transmission network (the high voltage power infrastructure in England and Wales) and separately manages the transmission network to ensure the grid remains balanced and supply meets demand at all times. More information can be found on these roles on [the NG website](#).

⁸⁶ House of Commons Library, [Net Zero in the UK](#), 16 December 2019

⁸⁷ National Grid, [Future Energy Scenarios](#), July 2019

⁸⁸ National Grid, [Future Energy Scenarios](#), July 2019, p77.

Source: National Grid, Future Energy Scenarios 2019

However, there are possible changes that could address this increase in demand. For example, if electric vehicle owners used “smart charging” or vehicle to grid (see section 4.2) the scale of the demand reduced significantly as the graph below for one scenario from FES shows:

Electric vehicle charging behaviour at system peak

Community Renewables

Source: National Grid, Future Energy Scenarios 2019

National Grid found that investment for EV infrastructure was needed, but that smart charging of electric vehicles, as a mechanism to help balance supply and demand on the grid (see section 4.2 below), would have benefits. For example, smart charging vehicles “could enable the storage of roughly one fifth of GB’s solar generation for when this energy is needed”. National Grid concluded:

The investment in infrastructure to support increasing numbers of electric vehicles indirectly benefits all energy consumers through lower prices and lower carbon generation intensity, as smart charging of EVs can support increased renewable generation.⁸⁹

Box 3: Concern over Government target and NG response

Following the Government’s announcement in July 2017 of plans to ban sales of “all new conventional petrol and diesel cars and vans” from 2040⁹⁰, concerns were raised by the media that this policy would require significantly more capacity in the power sector and present challenges for balancing the electricity grid. For example, [a Telegraph article](#)⁹¹ suggested 10 new power stations would be required.

⁸⁹ National Grid, *Future Energy Scenarios*, July 2019, p 4.

⁹⁰ Defra, *Plan for roadside NO₂ concentrations published*, Jul 2017

⁹¹ [Diesel and petrol car ban: Plan for 2040 unravels as 10 new power stations needed to cope with electric revolution](#), *The Daily Telegraph*, 27 July 2017

Many of the estimates, and media reports, on future energy demand with electric vehicles are based on NG's [Future Energy Scenarios 2017 \(FES\)](#).⁹² Due to the publicity around the issue, NG published a [myth-buster](#) explaining the range of scenarios and stating that they believed their figures had been misused.⁹³ NG said that some media projections had used a more "extreme" scenario which they believed was unlikely to occur. Under the scenario reported in the media, by 2046 NG's analysis estimated that peak demand as a result of EVs charging would be 30 GW. By contrast, the most likely scenario in NG's analysis saw peak demand from electric vehicles alone being around 5 GW, about an 8% increase on today's peak demand value. This is because NG believe the switch to EVs will not be as extreme, and consumer behaviour will change to avoid charging at peak times, therefore resulting in a less significant increase to peak demand.⁹⁴

The House of Commons Business, Energy and Industrial Strategy Committee's October 2018 report on Electric vehicles said that media concern about additional electricity demand were "overblown" and concluded that the electric vehicle transition is "unlikely to present a risk to the security of national electricity supply" and that any increased electricity demand would "necessitate investment in new generation."⁹⁵ The Committee also made recommendations on managing higher demand including that charge points should have smart capacity, and that the Government should look further into the opportunity of vehicle to grid technology.

4.1 The Capacity Market

The UK operates a [Capacity Market](#) to ensure there is sufficient power as the UK replaces older power stations with alternatives such as intermittent renewables. The Capacity Market is not just for EVs but covers all demands for electricity with the purpose of securing capacity to cover any potential shortfall in demand during peak periods.

The market works as an auction where capacity providers bid to offer a service to help balance the grid. The providers range between large power stations and smaller storage units that can supply power (which would not normally be generated due to high costs or inefficiencies), to industries that can reduce demand if there is a lack of supply in a process known as demand side response.⁹⁶ The market is paid for by consumers through their energy bills.

Ahead of the auction, the Secretary of State for Business, Energy and Industrial Strategy (BEIS) must decide the amount of capacity needed, following a recommendation from [National Grid](#) – which administers the capacity market auctions. This is a set amount of power that is required to keep the grid secure.

⁹² National Grid, [Future Energy Scenarios 2017](#), July 2017

⁹³ National Grid, [Our Energy Insights, Electric vehicle announcement and what the papers say](#), August 2017

⁹⁴ National Grid, [Our Energy Insights, Electric vehicle announcement and what the papers say](#), August 2017

⁹⁵ BEIS committee, [Electric vehicles: driving the transition](#), Fourteenth report of session 2017-19, Oct 2018

⁹⁶ Engie, [Understanding the Capacity Market](#), 2016

The capacity market began again in October 2019 following a suspension since November 2018. This suspension was due to a ruling from the General Court of the European Union which annulled the European Commission's 2014 approval of the UK's capacity market under state aid rules. The [ruling](#) effectively rendered the capacity market illegal as the Court decided that the Commission's original approval process was too short, and that the EU should have done further investigations into the scheme. In October 2019, the Commission [approved](#) the Capacity Market under EU State aid rules and the [Government gave notice](#) of the market's reinstatement.

4.2 Balancing the Grid

National Grid are the Transmission System Operator. They ensure that supply and demand always match on the electricity grid to prevent power cuts or increases in network frequency that could damage electrical equipment. This process is known as 'balancing'.

Balancing is an increasing challenge for National Grid due to the changing electricity mix. Previously, generation was predominantly provided by large, centralised power stations. However, electricity in the UK is now supplied by a greater variety of generators, including fossil fuels, nuclear power, and large and small-scale renewables. In July 2017, the Government and Ofgem, the energy regulator, published a report on upgrading the energy system: it outlined plans for transforming the grid with smart and flexible technologies.⁹⁷

For more information on grids and V2G, see the Library briefing paper on [Electricity grids](#)

Smart charging and Vehicle to Grid (V2G) technology

As shown above, wider proliferation of electric vehicles will add demand to the grid. However, smart charging can reduce charging at peak times, and the batteries in the vehicles could become an asset to National Grid, as they have the potential to be used for grid balancing.

'Smart' use of the electricity system involves using power at times when demand, and prices, are low. Consumers can benefit from cheaper power, and operators benefit from an easier to balance system and avoiding all cars being charged simultaneously, such as at the end of rush hour. Smart meters, which are currently being rolled out,⁹⁸ have the potential to allow more detailed information on consumption to be sent to energy suppliers, and more reactive use of power for customers. For example, 'Time-of-use' tariffs are already available from some energy suppliers,⁹⁹ rewarding customers with smart meters for using power at times of low demand. Integrating smart devices, such as smart charging electric cars, into this mechanism could mean that additional

⁹⁷ HMG/Ofgem, [Upgrading our energy system, Smart systems and flexibility plan](#), July 2017

⁹⁸ House of Commons Library, [Energy Smart Meters](#), 7 October 2019

⁹⁹ Andrew Ward, [Households offered first time-of-use energy tariff](#), Financial Times, 2 January 2017

demand for electric cars is significantly reduced (as section 4 above shows).¹⁰⁰

An extension of smart charging, the concept of 'Vehicle to Grid' (V2G), is that when supply is low and demand high, EVs connected to the grid to charge can instead release power back into the grid. Owners of the vehicles can then be paid for this balancing service in a similar way to electricity storage unit operators. In theory, if a vehicle is needed to be charged for a certain time the owner could register that time and this would override the use of the car as a power source.

In July 2017, the Government launched a V2G competition with £20 million of funding to develop the technology.¹⁰¹ As indicated in section 2.2. above, in February 2018 the Government announced a further £30 million investment in V2G.¹⁰²

¹⁰⁰ More information is available in the Library briefing paper on [Electricity Grids](#) (Section 5 – smart grids).

¹⁰¹ DfT press notice, [Innovative vehicle to grid technology to receive £20 million](#), 8 July 2017

¹⁰² DfT, [£30 million investment in revolutionary V2G technologies](#), Feb 2018

5. Emissions comparison: EVs and conventional vehicles

The total emissions from an EV are known as the “lifecycle emissions” and combine the emissions from manufacturing the vehicle, powering it through its life, and decommissioning. Several studies have been conducted on EV lifecycle emissions with varying conclusions based on the methodology and assumptions used by the researchers. These include factors such as the size of the car, driving and efficiency assumptions, and where the car is manufactured and charged.¹⁰³

The International Council on Clean Transportation (ICCT - an independent non-profit research and analysis organisation) published in 2018 a review of research on lifecycle emissions of EVs in Europe. This found that while EVs can have higher emissions at the manufacturing stage, these can be recovered over the lifetime of the car from reduced fuel emissions in relation to conventional vehicles, resulting in a lower overall lifecycle emission for EVs relative to average conventional cars.¹⁰⁴ However, as electric vehicle production and charging emissions are based on the energy mix where the EV is charged and used (e.g. the proportion of fossil fuel and low carbon sources), the lifecycle emissions of EVs vary between countries, and even locally. This national variation of the different lifecycle emissions is summarised below in a graph from the ICCT analysis:¹⁰⁵

¹⁰³ An overview of various studies is available from the environmental analysis website Carbon Brief, [Factcheck: How electric vehicles help to tackle climate change](#), 13 May 2019

¹⁰⁴ The International Council on Clean Transportation, [Effects of battery manufacturing on electric vehicle life-cycle greenhouse gas emissions](#), February 2019

¹⁰⁵ The International Council on Clean Transportation, [Effects of battery manufacturing on electric vehicle life-cycle greenhouse gas emissions](#), February 2019. Based on 2015 data and over 150,000km.

5.1 Vehicle manufacturing greenhouse gas emissions

The ICCT analysis said that the energy intensive production of batteries meant that EVs have higher manufacturing emissions than conventional cars and went on to conclude there was potential for manufacturing emissions to either increase or decrease in future:

Electric vehicle manufacturing requires more energy and produces more emissions than manufacturing a conventional car because of the electric vehicles' batteries. Lithium-ion battery production requires extracting and refining rare earth metals, and is energy intensive because of the high heat and sterile conditions involved. Most lithium-ion batteries in electric vehicles in Europe in 2016 were produced in Japan and South Korea, where approximately 25%–40% of electricity generation is from coal.

[...]

although the manufacturing of batteries does not outweigh the life-cycle environmental benefits of electric vehicles, these emissions are nonetheless substantial. These emissions could become more substantial as longer-range electric vehicles with larger batteries become more common. However, a number of trends point to reduced emissions from battery production in the future, further increasing the greenhouse gas savings offered by electric cars.¹⁰⁶

5.2 Fuel cycle greenhouse gas emissions

The emissions from the use of an EV can only be as clean as the charging power supply. In the UK, power is supplied from a variety of sources:

Source: [Digest of UK Energy Statistics \(DUKES\) 2019](#), DBEIS

¹⁰⁶ The International Council on Clean Transportation, [Effects of battery manufacturing on electric vehicle life-cycle greenhouse gas emissions](#), February 2019

The power sector was previously (until 2016) the largest sector of emissions, accounting for just under a quarter of UK emissions. According to the Committee on Climate Change's 2019 progress report to Parliament, power sector emissions reductions have seen "sustained progress" and are now 68% below 1990 levels. The transport sector is now the largest source of UK emissions, though after increases in recent years, transport emissions fell for the first time in 2018.¹⁰⁷ Increases in EVs will help to decarbonise the transport sector provided that there is also enough low carbon power to ensure that emissions from electricity production are lower than those of conventional diesel or petrol.

The Government has committed to decarbonising power through planning to phase out coal by 2025, and supporting the expansion of low-carbon power sources.¹⁰⁸ These and other actions are expected to continue to drive down the carbon intensity of the grid.¹⁰⁹

A June 2017 study for the power company Drax conducted by researchers at Imperial College London and the Open University found that EVs are causing fewer emissions over time due to decarbonisation of the power sector:

Producing the electricity to charge a Tesla Model S back in 2012 would have created 124 g per km driven – the same as a 180 horsepower Range Rover. Nowadays that has halved to 74 g/km in winter and 41 g/km in summer. Smaller cars like the Nissan Leaf and BMW i3 can be charged for less than half the CO₂ of the cleanest non-electric car on the market – the Toyota Prius hybrid.¹¹⁰

As such, while EVs are not technically 'zero emission', research suggests that in the UK are likely to have fewer emissions than the average conventional vehicle. EVs emissions have the potential to be reduced further in future as the power sector decarbonises and if manufacturing emissions are reduced.

Other impacts of EV production

Batteries for EVs can require rare elements such as lithium and cobalt, which has raised environmental and ethical issues in countries where these elements are mined¹¹¹ as well as questions over sustainable supply as demand for batteries grows.¹¹² For further information see POSTnote, [Access to Critical Materials](#), September 2019.

In addition, EV batteries can be difficult to recycle due to the multiple components. Government rules on waste batteries mean producers of batteries are responsible for their disposal.¹¹³ In an October 2018 report, [Electric vehicles: driving the transition](#), the Business, Energy and Industrial Strategy Committee said that further recycling facilities for

EVs produce fewer air pollutants than conventional vehicles when driven, as they have no exhaust emissions. More information on air pollution is available in [HC Library briefing paper CBP 8179](#).

lithium batteries will be required as the number of retired electric vehicles increases and highlighted calls for waste disposal options to be addressed by policy:

92. Materials recycling may be important in the longer term, as the stockpile of batteries requiring disposal increases and particularly if anticipated materials shortages come to fruition. The risk of cobalt shortages has been identified as a major threat to global EV growth over the 2020s; according to the IEA, cobalt demand for EV batteries could increase by between 10 and 25 times by 2030. There are currently no UK treatment plants for disposal of batteries and only a single plant for processing lithium-ion batteries in continental Europe. The plant owners, Umicore, have invested £25 million in the plant and are piloting a process for the recycling of electric vehicle batteries in anticipation of a sizable market by 2025. Further facilities will be required as the number of EVs being retired increases. Witnesses agreed that disposal options for batteries needed to be addressed by policy, but had mixed views on whether the Government should seek to gain a lead in the development of second-life and battery recycling industries in the near-term. Nissan cautioned that timing would be important, to avoid scaling-up new industries before a steady supply of retired batteries is available.

93. Second life battery applications, EV end of life disposal and battery recycling are nascent areas that could offer significant industrial opportunities. We recommend that the Government explores the potential value of these to the UK and take a lead in developing those that are promising, before other countries gain a competitive edge.¹¹⁴

The (then) [Government's response to the Committee's report](#), published on 11 January 2019, set out work underway to improve battery recycling:

The Government agrees with the Committee that these areas offer significant industrial opportunities for the UK. One of the objectives of the Industrial Strategy Challenge Fund's Faraday Battery Challenge is: "A thriving UK industry in battery re-cycling / materials recovery/ reconditioning - enabling a circular economy and feeding a UK supply chain". In 2018 Birmingham University, as part of the Faraday programme, has led several collaborative Research & Development projects involving leading UK recovery and recycling companies and events to bring science and industry together to identify what is required in order to realise this potential.

Among the collaborative R&D projects funded by InnovateUK includes a project that will look at reusing, remanufacturing or recycling end-of-life, automotive lithium-ion batteries. It will support the building of a complete supply chain network, and the development of legal and regulatory knowledge on end-of-life batteries in the UK. This will help to optimise battery design and increase use in second-life applications, improve recyclability and whole-life environmental impact, whilst building UK capabilities.

A further project will aim to create a safe, economically sustainable battery recycling supply chain in the UK, which allows industrial batteries

31 Electric vehicles and infrastructure

from vehicles to be recycled into base components and materials and then reused.¹¹⁵

EV battery longevity varies between manufacturers but warranties are offered for between five and ten years and although capacity will decline over time, the battery will likely continue working beyond the warranty.¹¹⁶ The average age of a vehicle on the road has increased, from 6.8 years in 2003 to 7.8 recorded in 2015.¹¹⁷ This suggests that battery disposal rates are likely to be similar to normal vehicle disposal rates. Some car manufacturers have announced plans for reusing or recycling batteries,¹¹⁸ and in November 2017 the Government announced £40 million as part of the Industrial Strategy Challenge fund for 27 projects to make EV batteries longer lasting and cleaner.¹¹⁹

About the Library

The House of Commons Library research service provides MPs and their staff with the impartial briefing and evidence base they need to do their work in scrutinising Government, proposing legislation, and supporting constituents.

As well as providing MPs with a confidential service we publish open briefing papers, which are available on the Parliament website.

Every effort is made to ensure that the information contained in these publically available research briefings is correct at the time of publication. Readers should be aware however that briefings are not necessarily updated or otherwise amended to reflect subsequent changes.

If you have any comments on our briefings please email papers@parliament.uk. Authors are available to discuss the content of this briefing only with Members and their staff.

If you have any general questions about the work of the House of Commons you can email hcinfo@parliament.uk.

Disclaimer

This information is provided to Members of Parliament in support of their parliamentary duties. It is a general briefing only and should not be relied on as a substitute for specific advice. The House of Commons or the author(s) shall not be liable for any errors or omissions, or for any loss or damage of any kind arising from its use, and may remove, vary or amend any information at any time without prior notice.

The House of Commons accepts no responsibility for any references or links to, or the content of, information maintained by third parties. This information is provided subject to the [conditions of the Open Parliament Licence](#).
